

STRING FUNCTIONS

Several String functions can be used in CDS views. The list is provided in the table below. These functions are directly executed in the DB level.

Function	Description
Length	gives Length of String
Instr	finds the position of respective string within the corresponding field
Concatenate	joining two strings
Concatenate with Space	Third Parameter in this function represents the Number of space between two strings
Left	gives us left most characters equal to argument passed
Lower	converts all into lower case [Rather Subscript]
Lpad & Rpad	first parameter is field, second is the OUTPUT Length after padding, string that is to be padded
Ltrim & Rtrim	first parameter is field, second is string or character that is to be removed
Replace	second parameter finds the string to be replaced by the third
Substring	finds the string that you want – second parameter is starting position and third is how many characters
Upper	converts all characters of string into Upper case
